

Ecommerce Sales Dashboard

Power BI Project Report

Dashboard file: Sales-Performance-Dashboard.pbix

Prepared: 18 July 2026

1. Executive Summary

This project delivers an interactive ecommerce sales dashboard in Microsoft Power BI. It brings together order-level and product-detail data to monitor commercial performance, profitability, customer contribution, product mix, geography, payment behavior, and seasonal trends from a single report page.

The dashboard is designed for business users who need a compact, filterable view of sales performance. It uses KPI cards for immediate monitoring and supporting visuals for diagnostic analysis. Quarter and state slicers enable users to focus the dashboard on a selected period or market.

2. Project Objectives

- Provide a single-screen view of ecommerce sales and profit performance.
- Track core KPIs including sales amount, quantity, profit, and average order value (AOV).
- Analyze profitability by month, product category, product sub-category, geography, customer, and payment mode.
- Enable self-service exploration through quarter and state filters.
- Support faster performance reviews and targeted business actions.

3. Data Model

The Power BI file contains two logical tables arranged in a relationship model. The report joins operational order attributes with transaction-level product and value measures.

Table	Purpose	Fields represented in dashboard
Orders	Order and customer context	Order Date, State, CustomerName
Details	Product and transaction measures	Category, Sub-Category, PaymentMode, Amount, Quantity, Profit, AOV

The report uses order-date hierarchy fields for temporal grouping and connects order context to sales-detail measures. This model supports slicing business outcomes by time, state, and customer while keeping product and payment analysis available in the same report.

4. KPI Framework

KPI	Power BI aggregation	Business use
Sales Amount	SUM(Details[Amount])	Tracks total sales value and provides the primary revenue view.
Quantity	SUM(Details[Quantity])	Measures units sold and product demand.
Profit	SUM(Details[Profit])	Monitors profitability across segments.
Average Order Value (AOV)	SUM(Details[AOV]) as configured in dashboard	Provides an order-value signal for basket and customer behavior analysis.

5. Dashboard Design and Visuals

The report canvas is titled “VAIBHAV ECOMMERCE SALES DASHBOARD” and follows a dark dashboard treatment. KPI cards appear alongside comparative charts and slicers, enabling a high-level summary followed by drill-down analysis.

Visual	Metric / field	Analytical purpose
KPI cards	Sales Amount, Quantity, Profit, AOV	Summarize headline performance measures.
Monthly profit column chart	Month of Order Date, Profit	Shows profit movement over time and helps identify

		seasonality.
Sub-category profit bar chart	Sub-Category, Profit	Ranks detailed product groups by profitability.
Category donut chart	Category, Quantity, Profit	Shows product-mix contribution.
Payment-mode donut chart	PaymentMode, Quantity, Profit	Reveals customer payment preferences and contribution.
State sales bar chart	State, Amount, Profit	Compares market-level performance.
Customer sales column chart	CustomerName, Amount, Profit	Identifies customer contribution and profit concentration.
Slicers	Quarter, State	Filters the full report for interactive analysis.

6. Analytical Workflow

- Load the Orders and Details tables into Power BI Desktop.
- Create and validate the relationship between order context and transaction details.
- Use measures or aggregations for sales amount, units, profit, and AOV.
- Build card visuals for executive-level KPIs.
- Create time, product, geography, customer, and payment-mode visuals for diagnosis.
- Add quarter and state slicers so every visual responds to user selection.
- Apply consistent formatting, titles, and interaction behavior to create a single cohesive dashboard.

7. Insights Enabled by the Dashboard

The PBIX report is configured to enable the following business questions. The dashboard file was reviewed for its report structure and field mappings; actual numeric values depend on the active filter context when opened in Power BI.

- Which months generate the highest and lowest profit?
- Which product categories and sub-categories contribute most to profit?
- Which states produce the strongest sales and profit outcomes?
- Which customers contribute the most sales value and profit?
- How does payment mode relate to quantity and profit contribution?
- How do headline KPIs change when a quarter or state is selected?

8. Technical Terms

Term	Definition
Power BI	Microsoft business-intelligence platform used to model, visualize, and share data insights.
KPI	Key Performance Indicator; a measurable value used to monitor business performance.
AOV	Average Order Value; an indicator of the average value generated per customer order.
Slicer	An interactive filter control that changes the context of report visuals.
Data model	The tables, relationships, and calculation logic that support a report.
Aggregation	A calculation that summarizes data, such as SUM, COUNT, or AVERAGE.

9. Recommendations and Next Steps

- Validate AOV logic with an explicit measure, typically Total Sales divided by Distinct Order Count, if order identifiers are available.
- Add profit margin percentage to complement absolute profit and improve product/category comparisons.
- Add year-over-year or month-over-month measures to turn the monthly chart into a performance-change diagnostic.
- Introduce target lines or KPI thresholds to clearly flag underperformance.
- Add tooltips and drill-through pages for deeper customer, state, and sub-category investigation.
- Publish the report to Power BI Service and configure scheduled refresh, row-level security, and workspace access as needed.

10. Conclusion

The Ecommerce Sales Dashboard provides a practical Power BI solution for monitoring sales, demand, and profitability in an interactive format. Its KPI cards, comparative visuals, and filtering controls provide both a concise management view and a structured starting point for operational analysis. The proposed next steps will strengthen metric governance, trend interpretation, and deployment readiness.
